Various incarnations of the TeXLive package are available:

- typically available in Linux package managers
- MacTex package for OSX
- MikTeX for Windows

Editor support is widely available:

- vim - vim-latex-suite
- emacs - auctex
- sublime text - L^AT_EXTools
- a large number of dedicated editors for L^AT_EX

Help!

There are two main methods of inserting mathematical statements into your text:

- inline: `$<maths>$`
- the math environment: `\[maths \]`

There are a handful of specialized math environments which can come in handy:

- `align` and `align*` - align each line on arbitrary characters (e.g. the equals sign)
- `proof` - a bit of extra formatting typically seen in proofs

Not Your Average Environment

Many things are different in the math environments, so make sure to read through the Mathematics and Advanced Mathematics sections in the WikiBook

Help!

Code listings are used to display source code in a document.

- `lstlisting` - listing environment
- many options available to customize and designate language

Package Required

The `listings` package is required to use code listings.

There are a handful of commands to abstract some common routines

- `\newcommand` - takes a name, num of arguments, and a definition
- `\newenvironment` - takes a name, num of arguments, and `\begin` and `\end` blocks
- basic programming constructs like conditionals and loops are also available to use

Help!

L^AT_EX is crazy complicated - where do you even start?

- L^AT_EX WikiBook: not exhaustive, but a great source
- T_EX.stackexchange.com: like StackOverflow, but for T_EX
- packages have documentation on CTAN (Comprehensive T_EX Archive Network)
- examples are a great place to find snippets (like this document!)
- ask me!
